

Creating Win-Wins with Landowners

Carbon capture and storage (CCS) uses proven technologies to safely capture, transport and permanently store carbon dioxide (CO₂) emissions thousands of feet deep, under impermeable layers of rock that act like a lid to lock the CO₂ underground. CCS projects will generate new investment dollars, create new, well-paying construction jobs, sustain existing jobs in Louisiana's critical industries, and generate state and local tax revenues.

Plus, the potential to have CO₂ safely stored, thousands of feet below the surface — or transported via a CO₂ pipeline buried safely underground — creates a new source of income from land that can continue to be used for farming or other activities.

ExxonMobil Respects Landowners

Many of ExxonMobil's land, operations and management team members live and work here. We understand and respect the passion and deep connection Louisianians have with their land.

ExxonMobil is committed to treating landowners with the utmost respect and reaching mutually beneficial agreements through good faith discussions.

We pledge to openly discuss your rights, our plans, and the laws and regulations governing both.

We look forward to explaining the science behind CCS, the benefits it can bring, and our proven practices to mitigate risks.

ExxonMobil encourages all landowners to carefully evaluate our offer and to request additional information that may assist them and their families in making a decision.

We stand ready to listen and address concerns about the CCS process and/or entering into an agreement with ExxonMobil.

If any landowner feels he or she has not been treated properly, we seek to handle grievances quickly and fairly.

Landowners play a key role in our projects, so we seek to build and maintain good relationships with them for the long term.

1,100+ Landowners

Landowners with interest in ExxonMobil-led CCS projects across LA, MS & TX

1,000+ Agreements
